## **Neural Network Basics**

L	ATEST	SUBMISSION	GRADE

100%

1.	What does a neuron compute?	1 / 1 point
	A neuron computes an activation function followed by a linear function (z = Wx + b)	
	A neuron computes the mean of all features before applying the output to an activation function	
	A neuron computes a function g that scales the input x linearly (Wx + b)	
	A neuron computes a linear function (z = Wx + b) followed by an activation function	
	Correct Correct, we generally say that the output of a neuron is a = g(Wx + b) where g is the activation function (sigmoid, tanh, ReLU,).	
2.	Which of these is the "Logistic Loss"?	1 / 1 point
	$ \bigcirc \mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = -(y^{(i)}\log(\hat{y}^{(i)}) + (1 - y^{(i)})\log(1 - \hat{y}^{(i)})) $	
	$\mathcal{L}^{(i)}(\hat{\mathbf{y}}^{(i)}, \mathbf{y}^{(i)}) = \max(0, \mathbf{y}^{(i)} - \hat{\mathbf{y}}^{(i)})$	
	$\bigcirc \mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) =  y^{(i)} - \hat{y}^{(i)} ^2$	
	$\bigcirc \mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) =  y^{(i)} - \hat{y}^{(i)} $	
	✓ Correct Correct, this is the logistic loss you've seen in lecture!	
3.	Suppose img is a (32,32,3) array, representing a 32x32 image with 3 color channels red, green and blue. How do you reshape this into a column vector?	1/1 point
	x = img.reshape((32*32,3))	
	x = img.reshape((3,32*32))	
	x = img.reshape((1,32*32,*3))	
	x = img.reshape((32*32*3,1))	
	✓ Correct	

4.	Consider	the two	following	random	arrays	"a"	and	"b":

```
1 a = np.random.randn(2, 3) # a.shape = (2, 3)
2 b = np.random.randn(2, 1) # b.shape = (2, 1)
3 c = a + b
```

What will be the shape of "c"?

- c.shape = (2, 1)
- c.shape = (3, 2)
- $\bigcirc$  c.shape = (2, 3)
- The computation cannot happen because the sizes don't match. It's going to be "Error"!

 $3 \quad c = a*b$ 

Yes! This is broadcasting. b (column vector) is copied 3 times so that it can be summed to each column of a.

5. Consider the two following random arrays "a" and "b":

1 a = np.random.randn(4, 3) # a.shape = (4, 3) 2 b = np.random.randn(3, 2) # b.shape = (3, 2)

What will be the shape of "c"?

- c.shape = (3, 3)
- c.shape = (4, 3)
- The computation cannot happen because the sizes don't match. It's going to be "Error"!
- c.shape = (4,2)

✓ Correct

Indeed! In numpy the "\*" operator indicates element-wise multiplication. It is different from "np.dot()". If you would try "c = np.dot(a,b)" you would get c.shape = (4, 2).

1 / 1 point

1 / 1 point

6.	Suppose you have $n_x$ input features per example. Recall that $X=[x^{(1)}x^{(2)}x^{(m)}].$ What is the dimension of X?	1/1 point
	$(m,1)$ $(m,n_x)$ $(1,m)$ $(n_x,m)$	
	✓ Correct	
7.	Recall that "np.dot(a,b)" performs a matrix multiplication on a and b, whereas "a*b" performs an element-wise multiplication.	1/1 point
	Consider the two following random arrays "a" and "b":  1	
	What is the shape of c?  c.shape = (12288, 150)  c.shape = (12288, 45)  The computation cannot happen because the sizes don't match. It's going to be "Error"!  c.shape = (150,150)	
	Correct Correct, remember that a np.dot(a, b) has shape (number of rows of a, number of columns of b). The sizes match because: "number of columns of a = 150 = number of rows of b"	
8.	Consider the following code snippet:	1/1 point
	<pre>1  # a.shape = (3,4) 2  # b.shape = (4,1) 3 4  for i in range(3): 5</pre>	
	How do you vectorize this?	
	c = a.T + b  c = a + b  c = a.T + b.T  c = a + b.T	
	✓ Correct	

## 9. Consider the following code:

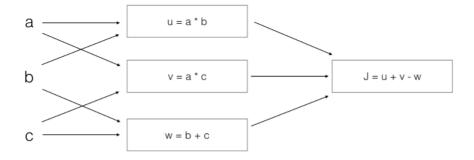

What will be c? (If you're not sure, feel free to run this in python to find out).

- This will invoke broadcasting, so b is copied three times to become (3,3), and \* is an element-wise product so c.shape will be (3, 3)
- This will invoke broadcasting, so b is copied three times to become (3, 3), and ∗ invokes a matrix multiplication operation of two 3x3 matrices so c.shape will be (3, 3)
- This will multiply a 3x3 matrix a with a 3x1 vector, thus resulting in a 3x1 vector. That is, c.shape = (3,1).
- It will lead to an error since you cannot use "\*" to operate on these two matrices. You need to instead use np.dot(a,b)

✓ Correct

## 10. Consider the following computation graph.

1 / 1 point

What is the output J?

 $\int J = (c - 1)*(b + a)$ 

 $\bigcirc$  J = (a - 1) \* (b + c)

 $\int J = a*b + b*c + a*c$ 

 $\int J = (b - 1) * (c + a)$ 

✓ Correct

Yes. J = u + v - w = a\*b + a\*c - (b + c) = a\*(b + c) - (b + c) = (a - 1)\*(b + c).
